## Chapter 1

## The computation of my life

## 1.1 A very special Rolling

We want to say something about dice rolling. Consider the roll of a N-sided dice that we roll **with explosion**. This means that on a roll of N, we roll again and add the result to the previous roll. This differ from a standard roll from the fact that the potential result is theoretically unbounded (although the probability decreases as the result increases). We denote this roll as  $dN^*$ .

If we then look at the probability of rolling n on such a dice, we get

$$\mathbb{P}_{N}(n) = \mathbb{P} \text{ (a roll of } dN^{*} \text{ gives } n) =$$

$$= \begin{cases}
0 & \text{if } n \text{ is a multiple of 6} \\
\frac{1}{N} & \text{if } 1 \leq n \leq N - 1 \\
\frac{1}{N^{2}} & \text{if } N + 1 \leq n < 2N - 1 \\
\vdots \\
\frac{1}{N^{k+1}} & \text{if } kN + 1 \leq n < (k+1)N - 1 \\
\vdots \\
= \sum_{k=0}^{+\infty} \frac{1}{N^{k+1}} \chi_{[kN+1,(k+1)N-1]}(n).$$
(1.2)

We want to understand what is the expected value as well as the variance for  $\mathbb{P}_N$ . To do that we need to remind ourselves of other computations.

#### 1.1.1 Geometric series

Consider a real number |x| < 1, and the following sum:

$$S_R(x) = 1 + x + x^2 + \dots + x^R.$$
 (1.4)

If  $x \neq 1$  (ensured by the fact that |x| < 1), we have that

$$S_R(x) = \frac{1 - x^R}{1 - x}. (1.5)$$

Using that |x| < 1, this means that as R grows,  $|x|^R$  goes to zero. So, if we perform the limit to R to infinity we get

$$\sum_{\ell=0}^{+\infty} x^{\ell} = \lim_{R \to +\infty} S_R(x) = \lim_{R \to +\infty} \frac{1 - x^R}{1 - x} = \frac{1}{1 - x}.$$
 (1.6)

We want to apply this to  $X := x^{-1}$ . In this case the condition becomes |X| > 1, and in this case we get the formula:

$$\sum_{\ell=0}^{+\infty} \frac{1}{X^{\ell}} = \frac{X}{X-1}.$$
(1.7)

We can also consider the sum starting from 1 and get

$$\sum_{\ell=1}^{+\infty} \frac{1}{X^{\ell}} = \frac{1}{X-1}.$$
 (1.8)

### 1.1.2 First and second moments of the geometric series

To compute the first two moments of the geometric series (1.8), we differentiate respect to X both sides. Differentiating the left side we get

$$\partial_X \left( \sum_{\ell=1}^{+\infty} \frac{1}{X^{\ell}} \right) = \sum_{\ell=1}^{+\infty} \frac{-\ell}{X^{\ell+1}} = -\sum_{\ell=2}^{+\infty} \frac{\ell-1}{X^{\ell}} = -\sum_{\ell=1}^{+\infty} \frac{\ell-1}{X^{\ell}}$$
 (1.9)

$$= -\sum_{\ell=1}^{+\infty} \frac{\ell}{X^{\ell}} + \sum_{\ell=1}^{+\infty} \frac{1}{X^{\ell}} = -\sum_{\ell=1}^{+\infty} \frac{\ell}{X^{\ell}} + \frac{1}{X-1}.$$
 (1.10)

We substitute now the definition in (1.8) to get

$$\sum_{\ell=1}^{+\infty} \frac{\ell}{X^{\ell}} = -\partial_X \left( \frac{1}{X-1} \right) + \frac{1}{X-1}$$

$$\tag{1.11}$$

$$= \frac{1}{(X-1)^2} + \frac{1}{X-1} = \frac{X}{(X-1)^2}$$
 (1.12)

If we differentiate again, the left term of (1.12) gives us

$$\partial_X \left( \sum_{\ell=1}^{+\infty} \frac{\ell}{X^{\ell}} \right) = \sum_{\ell=1}^{+\infty} \frac{-\ell^2}{X^{\ell+1}} = -\sum_{\ell=2}^{+\infty} \frac{(\ell-1)^2}{X^{\ell}} = -\sum_{\ell=1}^{+\infty} \frac{(\ell-1)^2}{X^{\ell}}$$
 (1.13)

$$= -\sum_{\ell=1}^{+\infty} \frac{\ell^2}{X^{\ell}} + 2\sum_{\ell=1}^{+\infty} \frac{\ell}{X^{\ell}} - \sum_{\ell=1}^{+\infty} \frac{1}{X^{\ell}}$$
 (1.14)

$$= -\sum_{\ell=1}^{+\infty} \frac{\ell^2}{X^{\ell}} + 2\left(\frac{1}{(X-1)^2} + \frac{1}{X-1}\right) - \frac{1}{X-1}$$
 (1.15)

$$= -\sum_{\ell=1}^{+\infty} \frac{\ell^2}{X^{\ell}} + \frac{2}{(X-1)^2} + \frac{1}{X-1}$$
 (1.16)

As a consequence, the second to last term in (1.12) we get

$$\sum_{\ell=1}^{+\infty} \frac{\ell^2}{X^{\ell}} = -\partial_X \left( \frac{1}{(X-1)^2} + \frac{1}{X-1} \right) + \frac{2}{(X-1)^2} + \frac{1}{X-1}$$
 (1.17)

$$= -\left(-\frac{2}{(X-1)^3} - \frac{1}{(X-1)^2}\right) + \frac{2}{(X-1)^2} + \frac{1}{X-1}$$
 (1.18)

$$= \frac{2}{(X-1)^3} + \frac{3}{(X-1)^2} + \frac{1}{X-1} = \frac{X(X+1)}{(X-1)^3}.$$
 (1.19)

#### 1.1.3 Finite sums

One can easily find also that the following two finite sums are true (which will be useful later):

$$\sum_{\ell=1}^{R} 1 = R,\tag{1.20}$$

$$\sum_{\ell=1}^{R} \ell = \frac{R(R+1)}{2},\tag{1.21}$$

$$\sum_{\ell=1}^{R} \ell^2 = \frac{R(R+1)(2R+1)}{6}.$$
 (1.22)

### 1.2 Expected value

To calculate the expected value, we proceed with an explicit calculation:

$$\mathbb{E}_{N} = \sum_{n=1}^{+\infty} n \mathbb{P}_{N}(n) = \sum_{n=1}^{+\infty} \sum_{k=0}^{+\infty} \frac{n}{N^{k+1}} \chi_{[kN+1,(k+1)N-1]}(n)$$
 (1.23)

$$= \sum_{m=0}^{+\infty} \sum_{j=1}^{N-1} \sum_{k=0}^{+\infty} \frac{mN+j}{N^{k+1}} \chi_{[kN+1,(k+1)N-1]} (mN+j).$$
 (1.24)

Given that j is between 1 and N-1,  $\chi_{[kN+1,(k+1)N-1]}(mN+j)$  is 0 if and only if m=k, otherwise is 1. As a consequence we get:

$$\mathbb{E}_{N} = \sum_{j=1}^{N-1} \sum_{k=0}^{+\infty} \frac{kN+j}{N^{k+1}} = \sum_{j=1}^{N-1} \left( \sum_{k=0}^{+\infty} \frac{kN}{N^{k+1}} + \sum_{k=0}^{+\infty} \frac{j}{N^{k+1}} \right)$$
(1.25)

$$= \sum_{j=1}^{N-1} \left( \sum_{k=1}^{+\infty} \frac{k}{N^k} + j \sum_{k=1}^{+\infty} \frac{1}{N^k} \right) = \sum_{j=1}^{N-1} \left( \frac{N}{(N-1)^2} + \frac{j}{N-1} \right)$$
 (1.26)

$$=\frac{N}{N-1} + \frac{N}{2} = \frac{N(N+1)}{2(N-1)}. (1.27)$$

For example, we get that the expected value for an exploding  $d6^*$  is 21/5 = 4, 2, slightly more than the one of a normal d6 (which is 3, 5).

We now look at the dispersion, computed through the variance:

$$\sigma_N = \sum_{n=1}^{+\infty} (n - \mathbb{E}_N)^2 \, \mathbb{P}_N \left( n \right) = \sum_{n=1}^{+\infty} n^2 \mathbb{P}_N \left( n \right) - \mathbb{E}_N \tag{1.28}$$

$$= \sum_{j=1}^{N-1} \sum_{k=0}^{+\infty} \frac{(kN+j)^2}{N^{k+1}} - \mathbb{E}_N$$
 (1.29)

$$= \sum_{j=1}^{N-1} \left( \sum_{k=1}^{+\infty} \frac{k^2}{N^{k-1}} + 2j \sum_{k=1}^{+\infty} \frac{k}{N^k} + j^2 \sum_{k=0}^{+\infty} \frac{1}{N^{k+1}} \right) - \mathbb{E}_N$$
 (1.30)

$$= \sum_{j=1}^{N-1} \left( \sum_{k=0}^{+\infty} \frac{(k+1)^2}{N^k} + 2j \left( \frac{1}{N-1} + \frac{1}{(N-1)^2} \right) + j^2 \sum_{k=1}^{+\infty} \frac{1}{N^k} \right)$$
 (1.31)

$$-\mathbb{E}_N \tag{1.32}$$

$$= \sum_{i=1}^{N-1} \left( \sum_{k=1}^{+\infty} \frac{k^2}{N^k} + 2 \sum_{k=1}^{+\infty} \frac{k}{N^k} + \sum_{k=0}^{+\infty} \frac{1}{N^k} \right)$$
 (1.33)

$$+2j\left(\frac{1}{N-1} + \frac{1}{(N-1)^2}\right) + j^2 \sum_{k=1}^{+\infty} \frac{1}{N^k}\right) - \mathbb{E}_N$$
 (1.34)

$$= \sum_{j=1}^{N-1} \left( \frac{N(N+1)}{(N-1)^3} + 2 \frac{N}{(N-1)^2} + \frac{N}{N-1} \right)$$
 (1.35)

$$+2j\left(\frac{1}{N-1} + \frac{1}{(N-1)^2}\right) + \frac{j^2}{N-1}\right) - \mathbb{E}_N \tag{1.36}$$

$$= \frac{2N(N+1)}{(N-1)^2} + \frac{N^2}{N-1} + \frac{N(2N-1)}{6} - \mathbb{E}_N$$
 (1.37)

## 1.3 A very special Die

Consider now this configuration: we roll a d6; if it rolls more than 3, it counts as a 0, if it rolls a 3, we roll again and add the new result to the value of the dice, potentially rolling again or summing a 0. This new probability is

as follows:

$$\mathbb{P}_{N}^{0}(n) = \begin{cases}
\frac{1}{6} & \text{if } n = 0 \\
\frac{1}{6} & \text{if } n = 1, 2 \\
\frac{1}{12} & \text{if } n = 3 \\
\frac{1}{36} & \text{if } n = 4, 5
\end{cases}$$

$$\vdots$$

$$\frac{1}{2 \times 6^{k}} & \text{if } n = 3k \\
\frac{1}{6^{k+1}} & \text{if } n = 3k + 1, 3k + 2$$

$$\vdots$$

$$1 + \infty \quad 1 \quad + \infty \quad 1$$

$$1 + \infty \quad 1 \quad + \infty \quad 1$$

$$1 + \infty \quad 1 \quad + \infty \quad 1$$

$$1 + \infty \quad 1 \quad + \infty \quad 1$$

$$1 + \infty \quad 1 \quad + \infty \quad 1$$

$$1 + \infty \quad 1 \quad + \infty \quad 1$$

$$1 + \infty \quad 1 \quad + \infty \quad 1$$

$$1 + \infty \quad 1 \quad + \infty \quad 1$$

$$1 + \infty \quad 1 \quad + \infty \quad 1$$

$$1 + \infty \quad 1 \quad + \infty \quad 1$$

$$1 + \infty \quad 1 \quad + \infty \quad 1$$

$$1 + \infty \quad 1 \quad + \infty \quad 1$$

$$= \frac{1}{2} \sum_{k=0}^{+\infty} \frac{1}{6^k} \chi_{3k}(n) + \sum_{k=0}^{+\infty} \frac{1}{6^{k+1}} \left[ \chi_{3k+1}(n) + \chi_{3k+2}(n) \right]. \tag{1.39}$$

We can now compute the expected value and we get

$$\mathbb{E}_{N}^{0} = \sum_{n=0}^{+\infty} n \left[ \frac{1}{2} \sum_{k=0}^{+\infty} \frac{1}{6^{k}} \chi_{3k}(n) + \sum_{k=0}^{+\infty} \frac{1}{6^{k+1}} \left[ \chi_{3k+1}(n) + \chi_{3k+2}(n) \right] \right]$$
(1.40)

$$= \frac{1}{2} \sum_{k=0}^{+\infty} \frac{3k}{6^k} + \sum_{k=0}^{+\infty} \frac{6k+3}{6^{k+1}} = \frac{3}{2} \sum_{k=0}^{+\infty} \frac{k}{6^k} + \sum_{k=0}^{+\infty} \frac{k}{6^k} + 3 \sum_{k=0}^{+\infty} \frac{1}{6^{k+1}}$$
 (1.41)

$$= \frac{5}{2} \sum_{k=1}^{+\infty} \frac{k}{6^k} + 3 \sum_{k=1}^{+\infty} \frac{1}{6^k} = \frac{5}{2} \times \frac{6}{25} + 3 \times \frac{1}{5} = \frac{6}{5}.$$
 (1.42)
